How Google Search Engine Works?

Google Search is a fully-automated search engine that uses software known as **web crawlers** that **explore** the web **regularly** to find pages to add to **their index**.

In fact, the vast majority of pages listed in google results **aren't** manually submitted for inclusion, but are found and added **automatically** when their web crawlers explore the web.

- First, It's important to note that Google doesn't accept payment to crawl a site more frequently, or rank it higher.
- Google doesn't guarantee that it will crawl, index, or serve your page, even if your page follows the Google Search Essentials.

Google Search 3 stages:

Google Search works in three stages, and not all pages make it through each stage:

1. **Crawling:** Google downloads text, images, and videos from pages it found on the internet with automated programs called crawlers.
2. **Indexing:** Google analyzes the text, images, and video files on the page, and stores the information in the Google index, which is a large database.
3. **Serving search results:** When a user searches on Google, Google returns information that's relevant to the user's query.

[Old Video](#)

[New Video](#)

Google Search 3 stages:

For you: Crawling

- Google starts by discovering web pages (URL discovery) since there is no central list of all pages
- Pages are found through:
 - Previously known pages
 - Links from existing pages
 - Submitted sitemaps
- After discovery, Google may **crawl** the page to understand its content
- Crawling is done by **Googlebot**, which scans billions of pages using algorithms
- Googlebot decides:
 - Which sites to crawl
 - How often
 - How many pages to fetch
- It avoids overloading websites by adjusting speed based on server responses
- Not all pages are crawled:
 - Some are blocked by site owners (**How**)
 - Some require login access
- During crawling, Google **renders pages (including JavaScript)** to fully understand content
- Crawling depends on accessibility; common issues include:
 - Server problems
 - Network issues
 - Robots.txt restrictions

For you: Indexing

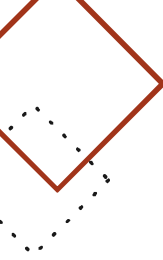

- After crawling, Google moves to **indexing**, where it understands what the page is about
- Indexing includes analyzing:
 - text content
 - key tags (e.g., title, alt attributes)
 - images and videos
- Google checks for **duplicate content** and selects a **canonical page** (the preferred, representative version of a web page selected from a group of duplicate, near-duplicate, or similar pages)
- Similar pages are grouped into clusters, and the most representative one is chosen
- Other versions may appear in specific contexts (e.g., mobile or detailed searches)-
- Google collects signals about the page, such as:
 - language
 - location relevance
 - usability
- This information is stored in the **Google index** (a large database)
- Not all pages are indexed, indexing is **not guaranteed**
- Common indexing issues include:
 - low-quality content
 - [robots meta tags blocking indexing](#)
 - [poor website design affecting accessibility](#)

For you: Serving Search Result

- When a user searches, Google looks through its index to find the most **relevant and high-quality pages**
- Relevance is based on many factors, including:
 - user location
 - language
 - device (mobile or desktop)
- Search results vary depending on the user (e.g., different results in different countries)
- The type of results shown also depends on the query:
 - local searches → show maps/results
 - visual searches → show images
- A page can be indexed but still not appear in results due to:
 - low relevance to the query
 - low-quality content
 - restrictions from robots meta tags
- Google continuously updates its algorithms to improve search results

What is SEO?

- **Recognise that there are two key aspects to any Search Engine Marketing SEM**
- **Search Engine Optimisation SEO:** is the process of refining your website so that it will be indexed and ranked by search engines, as well as leveraging your links from other sites
- **Pay Per Click PPC:** advertising is advertising within search results and user only pays when the user clicks.
- **SEO:** refers to the practice of **optimizing** your website and its **content** to improve its **visibility** in search engine results pages **SERPs**.
- **The goal of SEO:** is to drive organic, non-paid, and targeted traffic to your website by making it more relevant and authoritative in the eyes of search engines.
- While there's **no guarantee** that any particular site will be added to Google's index, sites that follow the **Search Essentials are more likely to show up in Google's search results.**

Types Of Search Intent

Informational

Users are looking for information or answers to questions.

Examples: "Tallest mountain in the world", "How to tie a tie", "Symptoms of the flu".

Transactional

Users have the intention to make a purchase or sign up for a service.

Examples: "Buy iPhone 12", "Netflix subscription plans", "Book a flight to New York".

Commercial

Users are in process of researching before making a transaction.

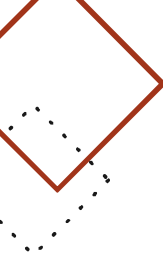

Examples: "Best SEO tools 2023", "iPhone vs. Android comparison", "Top web hosting services".

Navigational

Users are trying to reach a specific website or page.

*Examples:
"Facebook login",
"SiteChecker Pro homepage", "Gmail sign in".*

What is SERP And What it features?

A SERP feature is any result on a Google Search Engine Results Page (SERP) that is not a traditional organic result. The most

Common SERP Features are:

- 1- **Rich Snippets:** are enhanced Google search results that display extra data beyond the standard title, URL, and description, such as star ratings, images, price, or recipe times
- 2- **Paid Results** that are bought by bidding on keywords (e.g., Ads or Google Shopping)
- 3- **Universal Results** is Google's practice of integrating diverse content formats—such as images, videos, local maps, news, and books directly into the main organic search results, rather than just displaying traditional text-based links.
- 4- **Knowledge Graph** data which appears as panels or boxes. Powers the sidebar panels in search results, connecting entities like "Albert Einstein" "born in" "Germany" to provide summarized information.

TYPES OF SERP FEATURES

How positioning affects clicks?

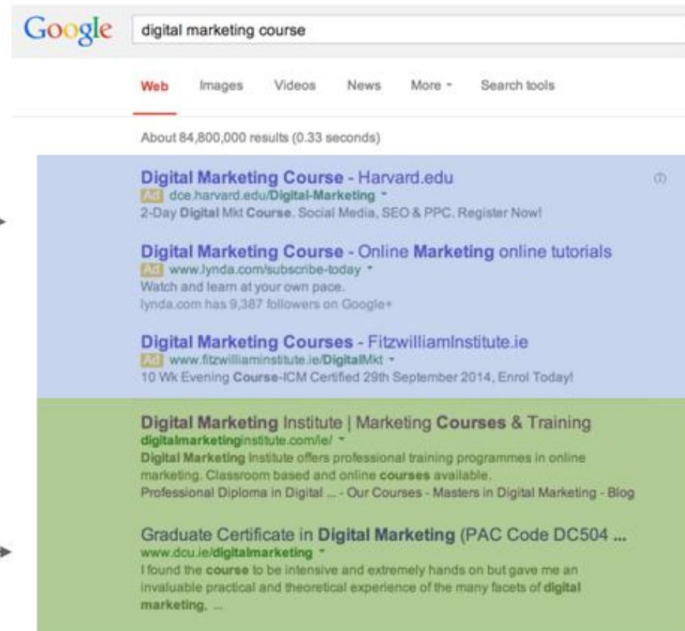

1. The proportionality of clicks between organic and paid.
2. Generally, the higher a listing appears on the search results page, the more clicks it receives
3. Few users go beyond the first page

30% of users
click here and
on the right
Paid listings

70% of users
click here
Organic listings

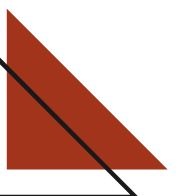

How long until I see impact in search results?

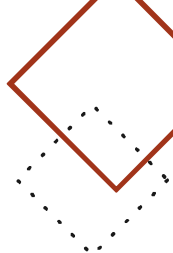

- Every change you make will take some time to be reflected on Google's end.
- Some changes might take effect in a **few hours**, others could take **several months**.
- In general, you likely want to wait a few weeks to assess whether your work had beneficial effects in Google Search results.

Help Google find your website

- Check if Google has already found your content (maybe you don't need to do anything!). Try searching on Google for your site with the [site: search operator](#). If you see results pointing to your site, you're in the index.
 - For example, a search for `site:wikipedia.org` returns [these results](#). If you don't see your site, check out the [technical requirements](#) to make sure there's nothing technically preventing your site from showing in Google Search, and then come back here.
- 

Google Search Essentials

The Google Search Essentials make up the core parts of what makes your web-based content (**web pages, images, videos, or other publicly-available material that Google finds on the web**) eligible to appear and perform well on Google Search:

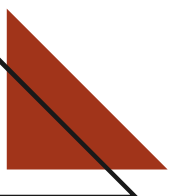

- **Technical requirements:** What Google needs from a web page to show it in Google Search.
- **Spam policies:** The behaviors and tactics that can lead to lower ranking or being completely omitted from Google Search results.
- **Key best practices:** The main things that can help improve how your site appears in Google Search results.

Technical requirements

The technical requirements cover the bare minimum that Google Search needs from a web page in order to show it in search results.

1. Googlebot isn't blocked.
 2. The page works, meaning that Google receives an HTTP 200 (success) status code. Client and server error pages aren't indexed.
 3. The page has indexable content. The textual content is in a file type that Google Search supports and doesn't violate googl's spam policies.
- 

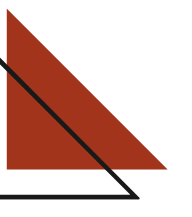

Spam policies

In the context of Google Search, spam refers to techniques used to deceive users or manipulate our Search systems into ranking content highly.

Google detect policy-violating practices both through automated systems and, as needed, human review that can result in a manual action. Sites that violate google's policies may rank lower in results or not appear in results at all.

Spam types:

1- Cloaking (تخفي): Cloaking refers to the practice of presenting different content to users and search engines with the intent to manipulate search rankings and mislead users. Examples of cloaking include:

- Showing a page about travel destinations to search engines while showing a page about discount drugs to users
- 

Spam policies

2- Doorway abuse: Doorway abuse is when sites or pages are created to rank for **specific, similar** search queries. Examples of doorway abuse include:

- Having multiple websites with slight variations to the URL and home page to maximize their reach for any specific query (امتلاك مواقع ويب متعددة مع اختلافات بسيطة في عنوان اللينك والصفحة الرئيسية لزيادة وصولها إلى أقصى عدد لأي استفسار محدد)
- Having multiple domain names or pages targeted at specific regions or cities that funnel users to one page

3- Expired domain abuse: Expired domain abuse is where an expired domain name is purchased and repurposed primarily to manipulate search rankings by hosting content that provides little to no value to users. Illustrative examples include, but are not limited to:

- Commercial medical products being sold on a site previously used by a non-profit medical charity
- Casino-related content on a former elementary school site

Spam policies

4- Hidden text and link abuse: Hidden text or link abuse is the practice of placing content on a page in a way solely to manipulate search engines and not to be easily viewable by human visitors.

Examples of hidden text or link abuse include:

- a. Using white text on a white background
- b. Hiding text behind an image
- c. Using CSS to position text off-screen
- d. Setting the font size or opacity to 0
- e. Hiding a link by only linking one small character (for example, a hyphen in the middle of a paragraph)

5- Keyword stuffing

6- Link spam

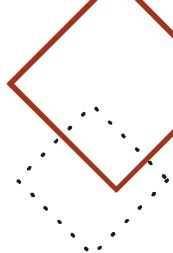

7- Machine-generated traffic

And Much Moreeeeeeee: <https://developers.google.com/search/docs/essentials/spam-policies>

Key best practices

While there are many things you can do to improve your site's SEO, there are a few core practices that can have the most impact on your web content's ranking and appearance on Google Search:

- Create helpful, reliable, people-first content.
- Use words that people would use to look for your content, and place those words in prominent locations on the page, such as the title and main heading of a page, and other descriptive locations such as alt text and link text.
- Make your links crawlable so that Google can find other pages on your site via the links on your page.
- If you have other content, such as images, videos, structured data, and JavaScript, make sure you're following those specific best practices so that Google can understand those parts of your page too.

For You: Overview of crawling and indexing

Removals

- [Control what you share with Google](#)
- [Remove a page hosted on your site from Google](#)
- [Remove images hosted on your page from search results](#)
- [Keep redacted information out of Google Search](#)

Site moves and changes

- [Redirects and Google Search](#)
- [Site moves](#)
- [Minimize A/B testing impact in Google Search](#)
- [Temporarily pause or disable a website](#)

Control XML-Sitemap

An XML sitemap is a file that lists a website's essential pages, acting as a roadmap for search engines to efficiently find, crawl, and index content. It improves SEO by ensuring new or deeply nested pages are discovered quickly.

A website's sitemap is usually located in the root directory.

Common Ways to Locate a Sitemap

- **Direct URL:** Type yourwebsite.com/sitemap.xml directly into the browser address bar.
- **Robots.txt:** Visit yourwebsite.com/robots.txt. Webmasters often list the sitemap path here for search engines. Ex: <https://seocrawl.com/robots.txt>
- **Footer Links:** Scroll to the bottom of the website homepage and look for a "Sitemap" link.
- **Google Search Console:** If you own the site, check the "Sitemaps" section to find the submitted, officially recognized map.

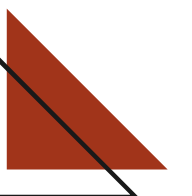

Technical Audit: READY?!

What is Technical SEO?

- Technical SEO refers to the behind-the-scenes elements that power your organic growth engine, such as **site architecture**, **mobile optimization**, and **page speed**.
 - The first step in improving your technical SEO is knowing where you stand by performing a **site audit**. The second step is to create a plan to address the areas where you fall short.
 - Technical SEO refers to anything you do that **makes your site easier for search engines to crawl and index**. Technical SEO, content strategy, and link-building strategies all work together to help your pages rank highly in search.
- 

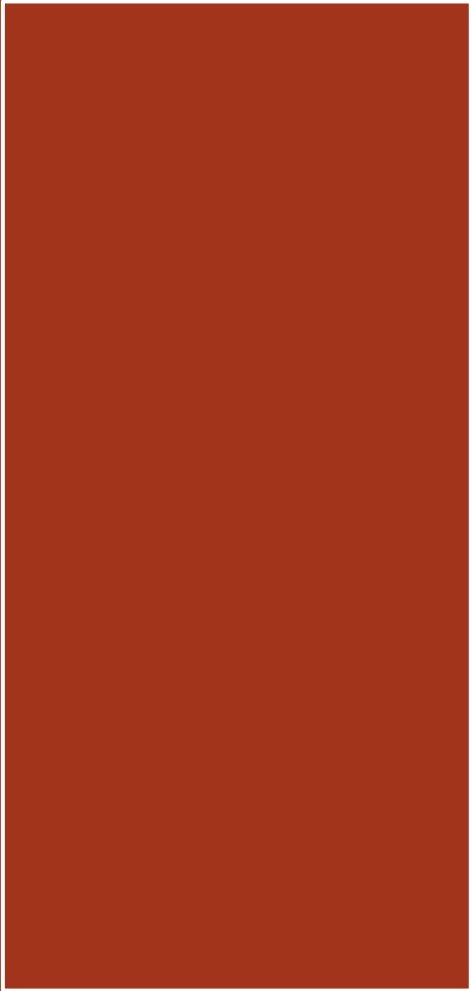

Technical SEO vs. On-Page SEO vs. Off-Page SEO

- **On-page SEO:** refers to the content that tells search engines (and readers!) what your page is about, including **image alt text, keyword usage, meta descriptions, H1 tags, URL naming, and internal linking**.
You have the most control over on-page SEO because, well, everything is on your site.
- **Off-page SEO:** tells search engines how popular and useful your page is through **votes of confidence** most notably **backlinks, or links from other sites to your own**.
Backlink quantity and quality boost a page's PageRank.
All things being equal, a page with 100 relevant links from credible sites will outrank a page with 50 relevant links from credible sites (or 100 irrelevant links from credible sites.)

On Page vs. Off Page vs. Technical SEO

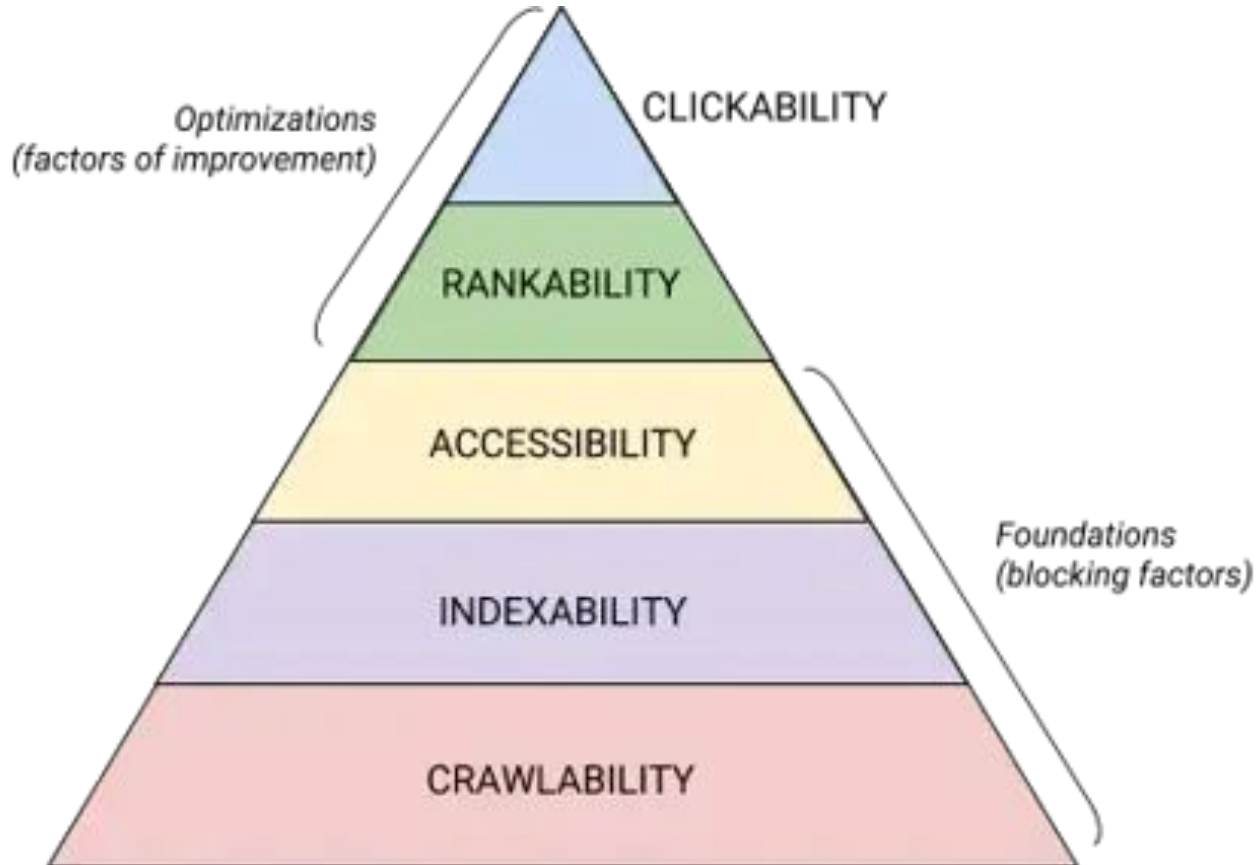

On Page SEO	Off Page SEO	Technical SEO
Site content	Link Building	Site speed
Title tag and meta tag optimization	Content marketing	Structured data
H tag optimization	Social media	Canonicalization
Internal linking	Podcasts	XML Sitemaps
Image optimization	Reviews	Hreflang
and more	and more	and more

Technical Audit Categories:

Technical SEO: 5 Categories

But First, The fundamentals:

1- Audit Your Preferred Domain: Your domain is your website's main address, and choosing a preferred version (either with “www” or without it or “http” or “https”) is important for SEO. Choose one version and **redirect** the rest to it, If you didn't then this means you have 4 copies of the same website, which will confuse the crawlers.

2- Implement SSL: Secure Sockets Layer, creates a layer of protection between the web server (the software responsible for fulfilling an online request) and a browser, thereby making your site secure.

When a user sends information to your website, like **payment** or contact info, that information is **less likely** to be hacked because you have SSL to protect them.

An SSL certificate is mentioned by a domain that begins with “https://” as opposed to “http://” and a lock symbol in the URL bar.

After you set up SSL, you'll need to **migrate any non-SSL pages from http to https**. It's a tall order, but worth the effort in the name of improved ranking.

But First, The fundamentals:

40 percent of users leave a website if it takes more than three seconds to load.

3- Optimize Page Speed: Site speed isn't just important for user experience and conversion, it's also a ranking factor. Use these tips to improve your average page load time:

- **Compress all of your files.** Compression reduces the size of your images, as well as CSS, HTML, and JavaScript files, so they take up less space and load faster.
- **Audit redirects regularly.** A 301 redirect takes a few seconds to process. Multiply that over several pages or layers of redirects, and you'll seriously impact your site speed.
- **Trim down your code.** Messy code can negatively impact your site speed. Messy code means code that's lazy.
- **Consider a content distribution network (CDN).** CDNs are distributed web servers that store copies of your website in various geographical locations and deliver your site based on the searcher's location.
- **Take advantage of cache plugins.** Cache plugins store a static version of your site to send to returning users, thereby decreasing the time to load the site during repeat visits.

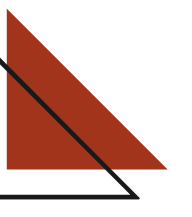

Page Speed Insights

Crawlability Checklist

- **Create an XML sitemap:** An XML sitemap is a file that lists a website's essential pages, acting as a roadmap for search engines to efficiently find, crawl, and index content.
- **Maximize your crawl budget:** Your crawl budget refers to the pages and resources on your site search bots will crawl. Because crawl budget isn't infinite, make sure you're prioritizing your most important pages for crawling.
- **Optimize your site architecture:** Example in next slide
- **Set a URL structure:** Refers to how you structure your URLs, which could be determined by your site architecture.

Check next slide for subdirectory & subfolder → Structure

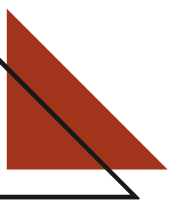

A side Note:

Subdomains versus subdirectories:

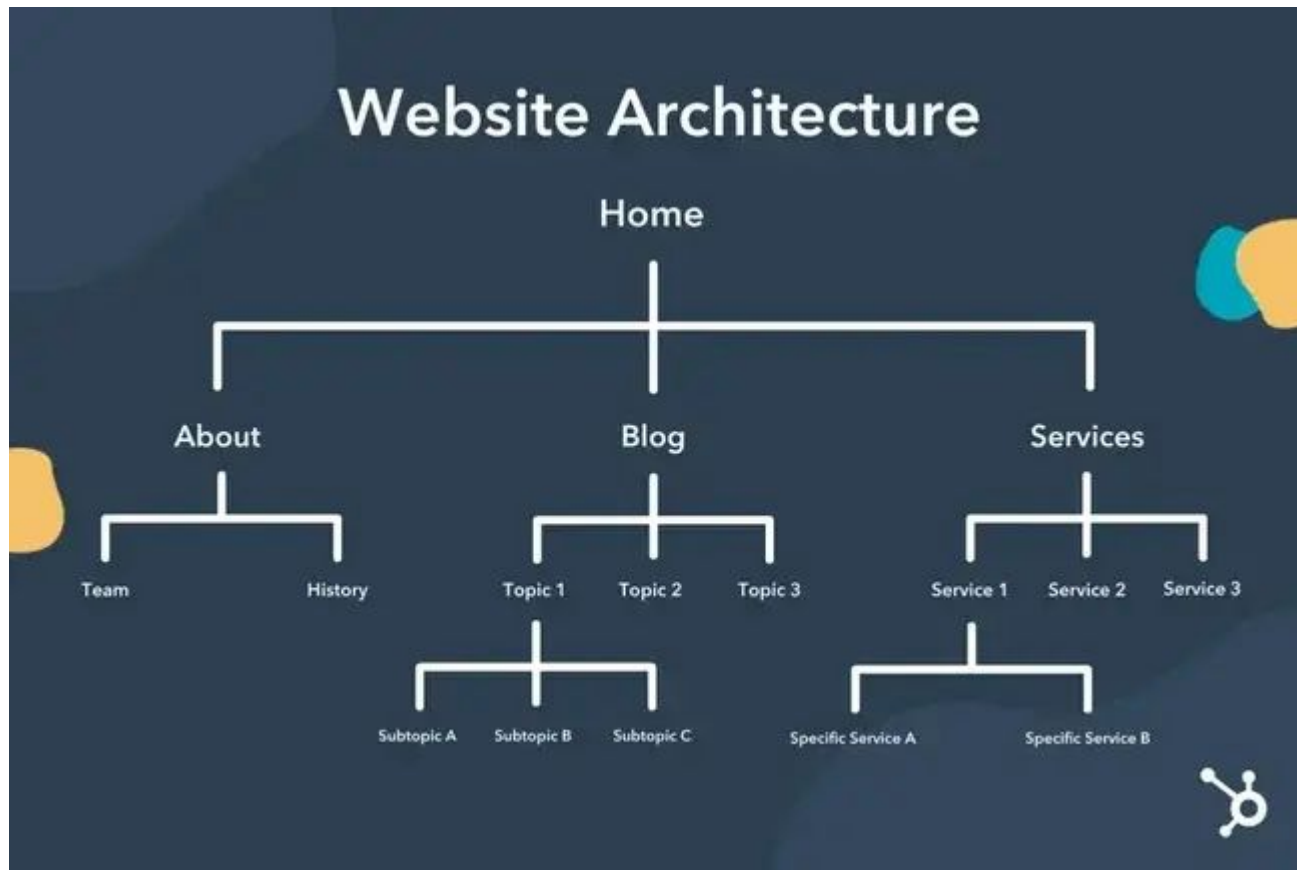

Subdirectories (yoursite.com/blog) are generally best for SEO, as they consolidate domain authority, whereas subdomains (blog.yoursite.com) act as separate entities, often requiring independent optimization.

Subdirectories are ideal for integrated content, while **subdomains** are better for completely separate sites, such as distinct international sites or client portals.

(Use lowercase characters - Use dashes to separate word - Make them short and descriptive - Avoid using unnecessary characters or words - Include your target keywords.

Your website has multiple pages. Those pages need to be organized in a way that allows search engines to easily find and crawl them.

Crawlability Checklist

- **Utilize robots.txt.** When a web robot crawls your site, it will first check the /robot.txt, otherwise known as the Robot Exclusion Protocol. This protocol can allow or disallow specific web robots to crawl your site.

“`robots.txt` acts as a restriction guide, telling search engines which pages not to crawl.

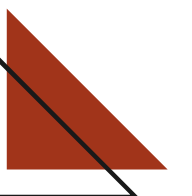

A `sitemap` (typically XML) is a map listing all important pages, encouraging search engines to crawl and index them. ”

- **Add breadcrumb menus:** It helps users know where they are and move in your site.
- **Use pagination:** Pagination uses code to tell search engines when pages with distinct URLs are related to each other. For instance, you may have a content series that you break up into chapters or multiple webpages. If you want to make it easy for search bots to discover and crawl these pages, then you'll use pagination.

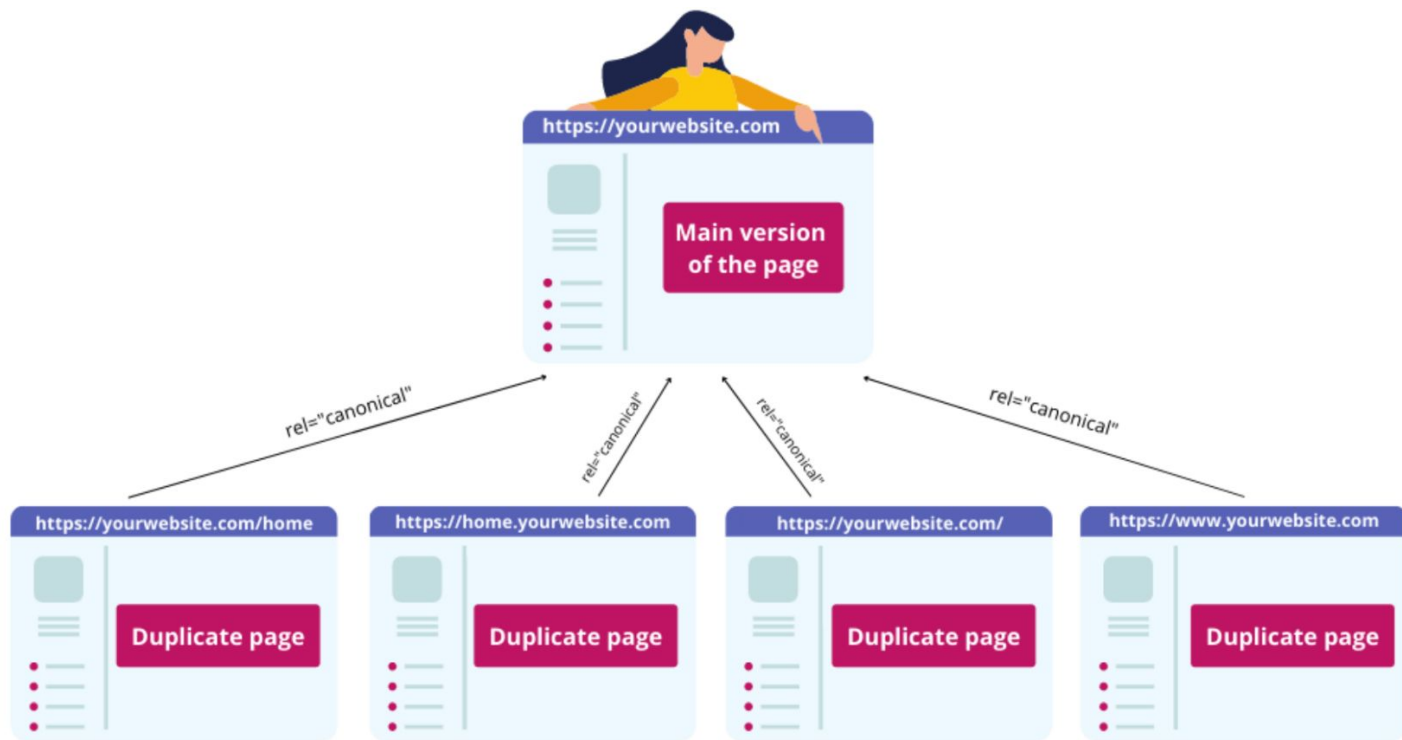

The way it works is pretty simple. You'll go to the <head> of page one of the series and use `rel="next"` to tell the search bot which page to crawl second. Then, on page two, you'll use `rel="prev"` to indicate the prior page and `rel="next"` to indicate the subsequent page, and so on.

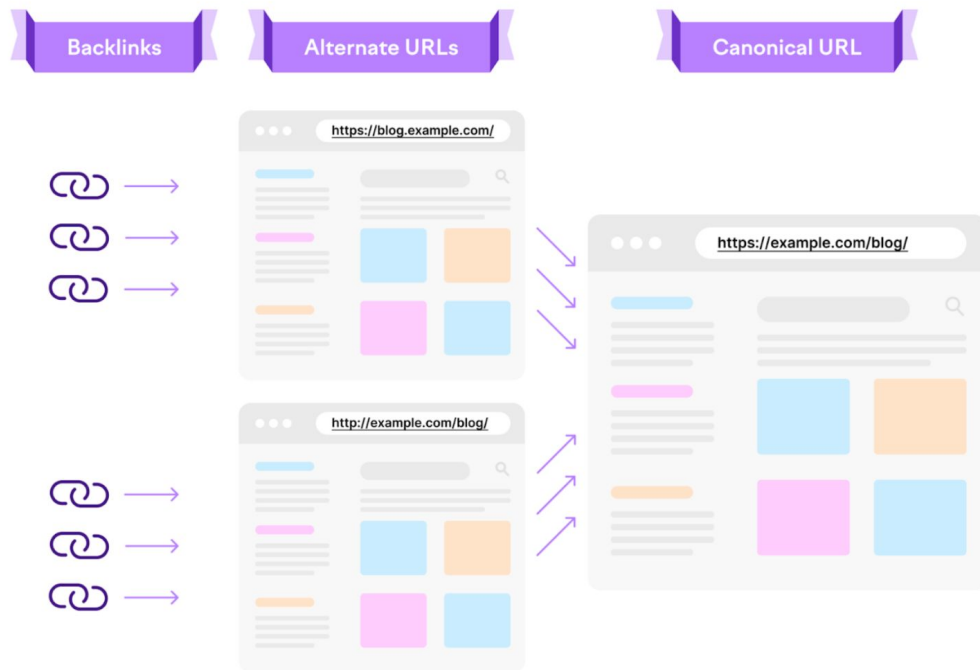

Indexability Checklist

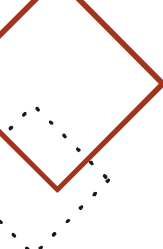

- **Unblock search bots from accessing pages:** This already being done at Crawlability, but just to make sure. Google's robots.txt tester will give you a list of pages that are disallowed and you can use the Google Search Console's Inspect tool to determine the cause of blocked pages.
 - **Remove duplicate content:** Duplicate content confuses search bots and negatively impacts your indexability. Remember to use canonical URLs to establish your preferred pages.
 - **Audit your redirects:** Verify that all of your redirects are set up properly. Redirect loops, broken URLs, or worse improper redirects can cause issues when your site is being indexed. To avoid this, audit all of your redirects regularly.
 - **Check the mobile-responsiveness of your site.** If your website is not mobile-friendly by now, then you're far behind where you need to be. As early as 2016, Google started indexing mobile sites first, prioritizing the mobile experience over desktop.
 - **Fix HTTP errors:** Fix them all but start with the urgents.
301, 302, 403, 404, 405, etc
- 

Canonical

Canonical

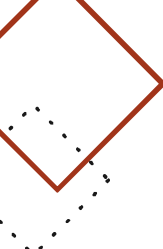

Renderability Checklist

An accessible site is based on ease of rendering. Below are the website elements to review for your renderability audit.

- **Server Performance:** As you learned above, server timeouts and errors will cause HTTP errors that hinder users and bots from accessing your site.
- **HTTP Status:** As you learned above, server timeouts and errors will cause HTTP errors that hinder users and bots from accessing your site. Load Time and Page Size
- **JavaScript Rendering:** Google admittedly has a difficult time processing JavaScript (JS) and, therefore, recommends employing pre-rendered content to improve accessibility.

[Google Render Tool - How Google sees my website](#)

Rankability Checklist

- **Internal and External Linking Links:** help search bots understand where a page fits in the grand scheme of a query and gives context for how to rank that page. Links guide search bots (and users) to related content and transfer page importance.
- **Backlink Quality:** Backlinks links from other sites back to your own provide a vote of confidence for your site. They tell search bots that External Website A believes your page is high-quality and worth crawling. As these votes add up, search bots notice and treat your site as more credible.
- **Content Clusters:** They contribute to organic growth. Content clusters link related content so search bots can easily find, crawl, and index all of the pages you own on a particular topic. **They act as a self-promotion tool** to show search engines how much you know about a topic, so they are more likely to rank your site as an authority for any related search query.

Tools for SEO Audit

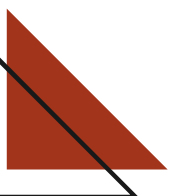

Google Analytics:

With Google Analytics, you Can:

- Get important insights regarding traffic
- Get insights about user behavior on your website
- Track individual events to measure the site's performance.

In addition, the tool can be linked with data from Google Search Console and Google AdWords, providing you with additional insights into how your website treats visitors.

Google Analytics is free and offers extensive analysis options for your SEO audit

Google Search Console:

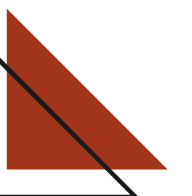

The free Google Search Console (GSC) is essential for any web project. The tool's data comes directly from Google and can help you in many ways with a ranking analysis. With GSC you will:

- **Get alerted on issues and fix your site:** Receive email alerts when Google identifies issues on your site. See which URLs are affected by these issues and tell Google when you've fixed them.
 - **Get your content on Google Submit sitemaps and individual URLs for crawling:** Review your index coverage to make sure that Google has the freshest view of your site.
- 

Google Search Console:

- You can use the GSC to send URLs to the Google index or devalue links using the “Disavow tool.”
- **Optimize your content with Search Analytics:** See which queries bring users to your site. Analyze your site's impressions, clicks, and position on Google Search.
- **Understand how Google Search sees your pages:** The URL Inspection tool provides detailed crawl, index, and serving information about your pages, directly from the Google index.

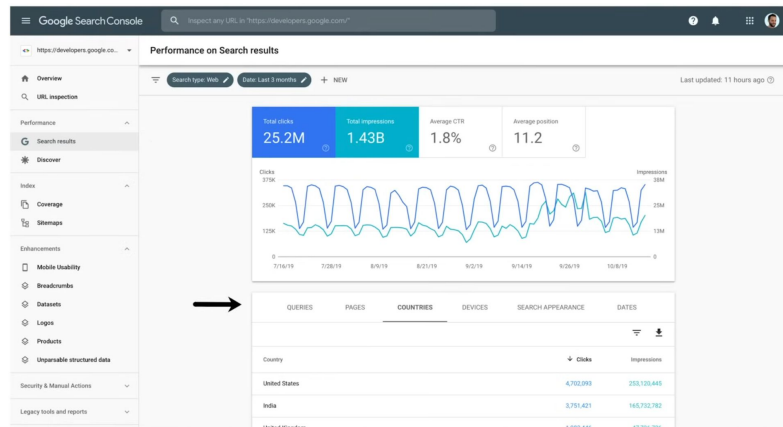

[Google Search Console Tool / Academy](#)

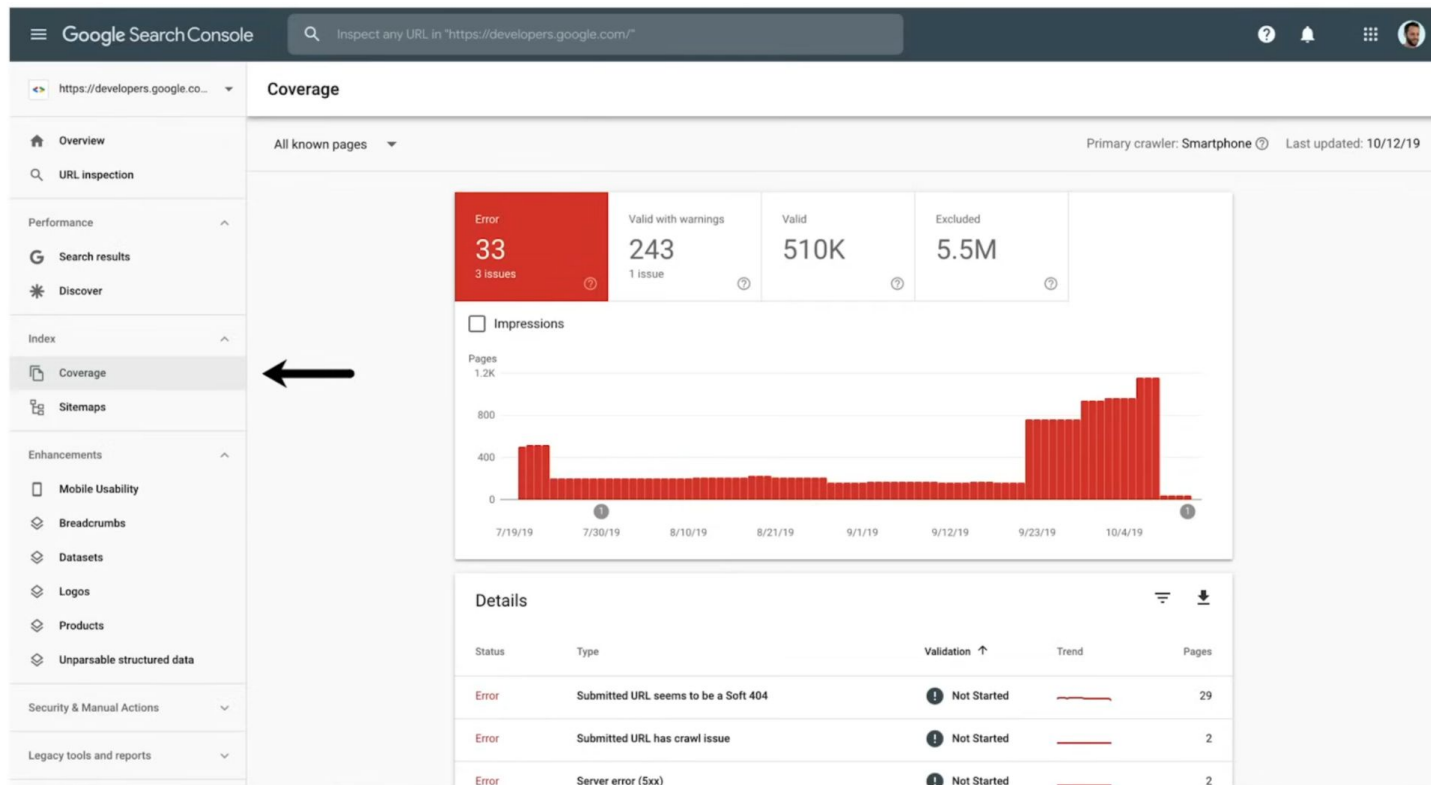

If you Own a small Website, Focus on:

- **Track Keywords & Queries:** Discover the exact search terms people are using to find your site.
- **Analyze Clicks & Impressions:** See how many times your site appears in search results (impressions) and how many people click through (clicks).
- **Monitor Search Position:** Track the average ranking position of your pages for specific search queries.
- **Improve CTR (Click-Through Rate):** Identify pages that rank well but have low click-through rates, suggesting you need better titles or meta descriptions

Coverage / Indexing Report

Coverage / Indexing Report

The Coverage report is a comprehensive overview of your entire site's indexing health

- **Identify and Monitor Crawlability Issues**

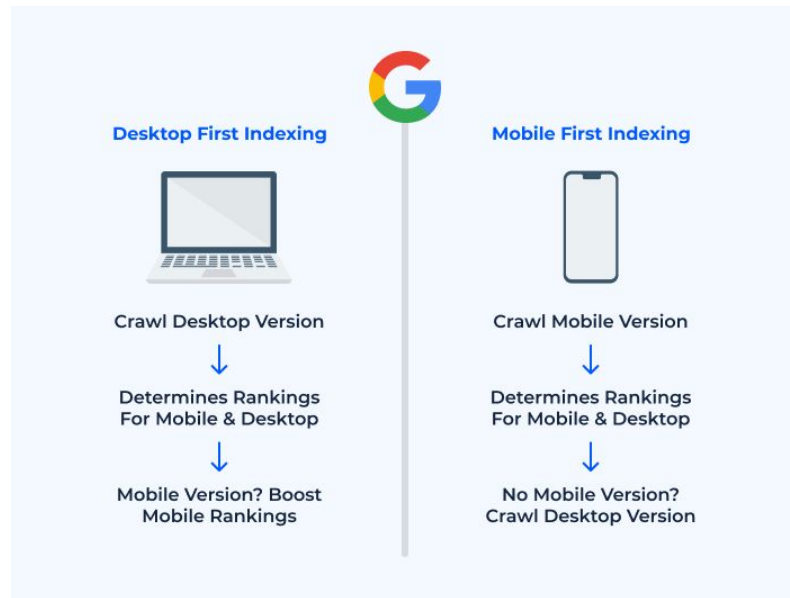

- **Fix Critical Errors:** Detect 404 errors, 5xx server errors, and soft 404s that prevent important pages from appearing in search results.
- **Find Blocked Content:** Use the report to identify URLs that are blocked by robots.txt

- **Diagnose Ranking & Indexing Problems**

- **Validate New Content:** Check if newly published products, articles, or services are being indexed properly by comparing the "Submitted and indexed" data against your total inventory.
- **Track Indexing Trends:** Monitor the graph of valid/excluded pages over time. A sudden drop in valid pages can indicate a major site migration issue or technical error.
- **Verify Fixes:** After your development team fixes an issue, use the "Validate Fix" button to have Google re-crawl the affected pages and confirm resolution.

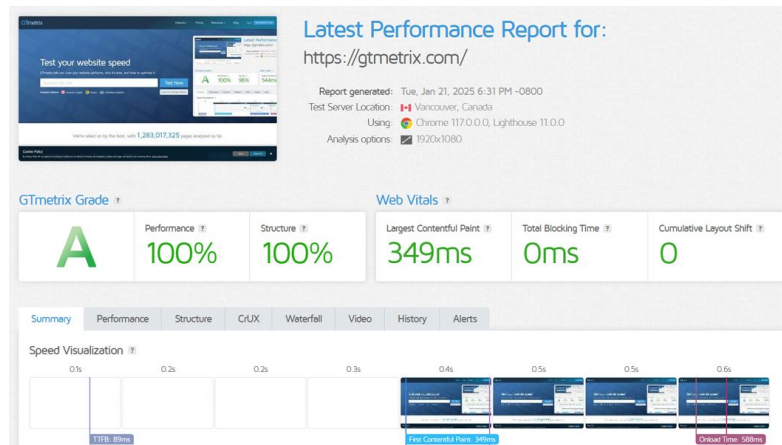

Mobile First Index:

Google predominantly uses the mobile version of a website's content for indexing and ranking, rather than the desktop version.

GTmetrix Tool

- **Performance Metrics**
- **Waterfall Charts:** Visualizes every resource on your page (images, CSS, JS) to see which elements take the longest to load.
- **Actionable Advice:** Gives specific, step-by-step recommendations for fixing performance bottlenecks.
- **Global Testing:** Tests site speed from over 26 different locations, allowing for accurate, localized user experience testing.
- **Mobile Testing & Simulation:** Simulates mobile browsers (Chrome on Android/iOS) and various connection speeds (e.g., broadband, 3G) to analyze performance, particularly in the Pro version.
- **Monitoring & Alerts:** Tracks performance over time, allowing users to schedule automatic tests and receive alerts if their site slows down.

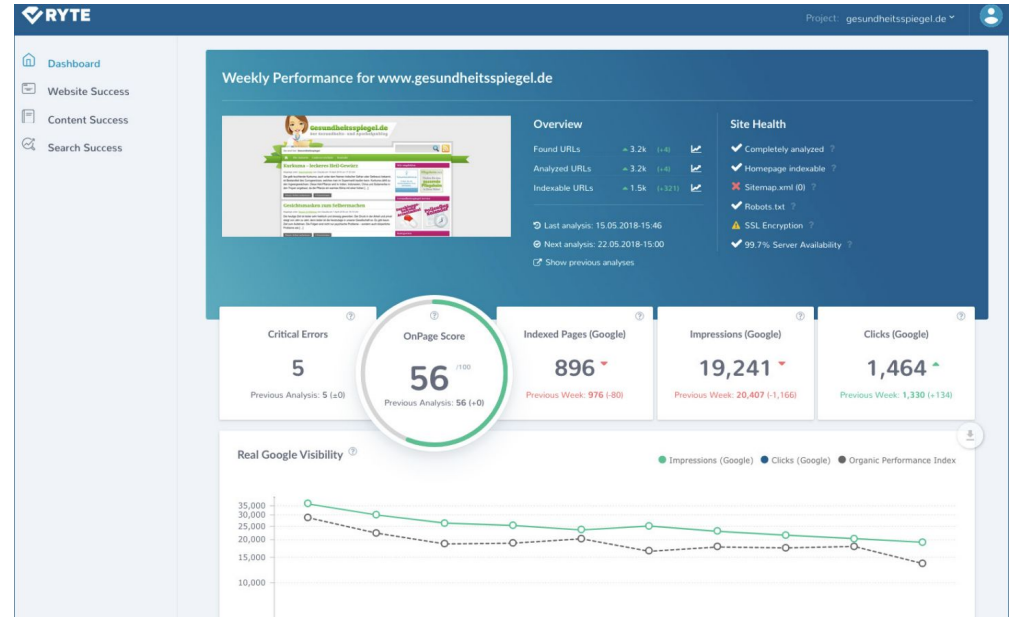

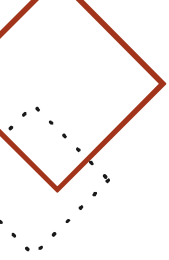

RYTE Tool

With Ryte, you can perform extensive On-Page analyses of your website, even with the free version.

Many reports can also be saved directly as PDF files. You can also create custom filters to perform your SEO audits efficiently.

SEO Plugins

- **Google Lighthouse Plug-In for Chrome:** Google Lighthouse crawls current URLs and provides you with many starting points for On-Page optimization. You can install the Google Chrome extension for free.
- **Google Tag Assistant:** Google Tag Assistant is also a handy plugin that lets you check whether Google tracking codes are implemented and whether they are functioning properly.
- **SEO META in 1-Click:** This handy extension for Chrome allows you to get the central information about metadata and heading structures of a URL in one click. It also checks whether the robots.txt or Sitemap.xml is implemented.
