

Check Your On-Page Elements

On-Page Optimization

The On-Page check is one of the most important components of your SEO audit.

1- Check your page titles: Title tags are probably the easiest on-page elements to optimize. They are used to rank relevant elements on your website.

- **Optimal Length:** 50–60 characters.
- **Pixel Width Constraint:** Google uses a 600-pixel container, so longer characters (like W) fill space faster than shorter ones (like I).

We can use RYTE, [MOZ.COM](https://moz.com), ScreamingFrog, SEO META in 1-Click Plug-In for Chrome

On-Page Optimization

Also, Google Search Console tool can show you duplicate, missing titles.

To do this, click “Display in search,” then “HTML improvements.” The incorrect page titles can be downloaded directly as an Excel spreadsheet.

The screenshot shows the Google Search Console interface. The left sidebar contains navigation links: Dashboard, Messages (2), Search Appearance (expanded), Search Traffic, Google Index, Crawl, Security Issues, and Web Tools. Under Search Appearance, the links are Structured Data, Rich Cards, Data Highlighter, HTML Improvements (highlighted in red), and Accelerated Mobile Pages. The main content area is titled "HTML Improvements" and includes a "Duplicate title tags" section. Below this, there is a "Download this table" button and a table of pages with duplicate title tags. The table has two columns: "Pages" and "Pages". The first row shows a page with a duplicate title tag and a count of 2. The second row shows another page with a duplicate title tag and a count of 2. At the bottom right of the table, there is a pagination control showing "1-2 of 2" and navigation arrows.

Duplicate title tags

Your title provides users and search engines with useful information about your site. Text contained in title tags can appear in search results pages, and relevant, descriptive text is more likely to be clicked on. We recommend reviewing the list and updating the title tags wherever possible.

Download this table

Pages	Pages
▶ https://www.example.com/page1.html	2
▶ https://www.example.com/page2.html	2

1-2 of 2

On-Page Optimization

2- Check meta-descriptions: Although the meta-description is not relevant for ranking, it can positively influence the click rate in SERPs. Google can use meta-descriptions for snippets in the SERPs. Thus, this meta element is one of the first components of your website that a user sees during a web search.

Then Why it is important?

- It boosts CTR: A compelling description can improve the CTR which is an indirect ranking signal
- Improves User experience: It helps users understand what this page is about, which helps reduce bounce rate

Best Practice:

- Keep it brief: 120-158 character
- Include keywords
- Make it actionable
- Unique for every page

[Title & Description SE Ranking Checker](#)

[Title & Description To The Web Checker](#)

You also can find the report in Ryte under
“Content, Description“

On-Page Optimization

Google does not use the **keywords meta tag** in web ranking

- Definition: A hidden tag in the HTML source code (`<meta name="keywords" content="keyword1, keyword2">`) meant for search engine crawlers rather than users.
- Irrelevance in Modern SEO: Google does not use the keywords meta tag in its search ranking anymore.

On-Page Optimization

3- Check headline structure, especially the H1 tags:

A proper headline structure, particularly the use of H1 tags, is a **foundational** element of on-page SEO that **aids** search engine understanding, improves accessibility, and enhances user experience. **The primary goal of header tags is to define the content hierarchy**, not just to control text size.

- **One H1 per Page:** While modern HTML5 technically allows multiple <h1> tags, SEO best practice is to use only one <h1> per page. This ensures a clear, focused, and non-confusing topic signal to search engines.
 - **Include Primary Keyword:** The target keyword for the page should appear naturally in the H1 tag, preferably near the beginning.
 - **Keep it Descriptive:** The H1 should act as the main title of the document, accurately summarizing the content of the page.
 - **Character Length:** Keep H1 tags under 70 characters (or ideally 50–60) to avoid truncation in search results and improve readability.
- 

On-Page Optimization

3- ALT attributes: What is displayed without a picture?:

ALT attributes are displayed if a browser cannot display images for technical reasons. **For example, screen readers for the blind use these texts.** Therefore, ALT attributes are an important element of your website in terms of accessibility and alternative displaying of images.

In addition, the texts of ALT attributes **strengthen the keyword** focus of a target page.

4- Check URLs: Length, structure, and coding

Checking URLs involves validating length (ideally <100 characters), structure (using hyphens, lowercase, keywords), and encoding (properly handling special characters).

- Optimal Length: Keep URLs under 100 characters (ideally under 60) for better readability, search engine ranking, and sharing.
- Tools: Use [Sitechecker's URL Length Checker](#) or [iNet Ventures' URL Length Checker](#) to audit URL lengths in bulk.

On-Page Optimization

5- Check loading times:

Checking website loading times for SEO is crucial for rankings and user experience, with an ideal load time under 5 seconds.

- [PageSpeed Insights](#): Provides lab and field data (actual user experience) with actionable recommendations.
 - Pingdom Website Speed Test: Useful for finding performance grades, page sizes, and loading times. (For Specific Regions)
 - [GTmetrix](#): Offers in-depth reports, including performance scores and structure analysis.
 - WebPageTest: Allows for testing from specific locations and devices.
 - Google Lighthouse: An automated tool to improve performance.
- 

On-Page Optimization

6- Canonical Tags: Are they used correctly?:

Definition: A `<link rel="canonical" href="URL" />` tag identifies the primary source of content when similar or identical content is accessible through multiple URLs.

Purpose: It helps search engines, like Google, know which URL to index and display in search results, preventing the dilution of search rankings.

- **Use Absolute URLs:** Always use full URLs (e.g., <https://example.com/page>) rather than relative paths (/page).
- **Self-Referential Tags:** It is highly recommended to include a canonical tag on the main page that points to itself to reinforce its authority.
- **Lowercase URLs:** Use all lowercase letters in URLs, as search engines can treat uppercase and lowercase as different pages.
- **Placement:** The tag must be in the `<head>` section of the HTML, not the body.
- **Consistency:** Use only one canonical tag per page.

On-Page Optimization

6- Pagination: It is a web development and SEO technique that breaks large sets of content (such as product listings, blog archives, or search results) into smaller, manageable chunks across multiple, numbered pages.

Pagination can be used to tell Google that a series of pages will follow. **Google pays particular attention to the first page** of this series. The HTML tags “rel=next” and “rel=prev” are used for this.

How it looks like:

- In Page #1:
 - `<link rel=“next” href=“https://www.website.com/page-two” />`
- In Page #2:
 - `<link rel=“prev” href=“https://www.website.com/page-one” />`
 - `<link rel=“next” href=“https://www.website.com/page-three” />`

Keyword Research

What is Keyword Research?

Keyword research is the process of discovering words and phrases (aka “keywords”) that people use in search engines, like Google, Bing and YouTube

Keyword research impacts every other SEO task that you perform, including finding content topics, on-page SEO, email outreach, and content promotion.

Keyword research is usually the first step of any SEO campaign. WHY?

Keywords act as a strategic guide for SEO efforts, helping direct your content and measure progress effectively.

In addition, keyword research provides valuable insights into your target audience by revealing what they are searching for and the exact language they use, enabling more precise and relevant communication.

Discover Keywords Then Evaluate

How to Find Keyword Ideas?

1. **Brainstorm a List of Topics:** If I run a Digital marketing agency, I ask myself "What topics do people search for that are related to my business?"
2. **Wikipedia Table of Contents:** It offers expert-curated content organized into clear categories. To find keyword ideas, start by searching a broad term on Wikipedia.
3. **Searches Related To:** Check the "**Searches related to**" section at the bottom of Google results. Just search your topic and scroll down to see related keyword ideas.
4. **Use Google and YouTube Suggest:** when you search for your Keyword

Keywords Types:

- **Seed keywords:** are short-tail (one or two words), high-volume, and highly competitive terms that represent the core topics of a business or website. They are foundational to SEO, acting as the starting point for keyword research, from which tools generate thousands of long-tail keyword variations to build content strategy.
- **Keywords by search intent:** Search intent is the reason behind the search query (i.e., keyword). It's what people expect to find by using a keyword in a search engine. They are categorized into four main types
 - **Informational:** Users are looking for answers, research, or information, typically using words like "how," "what," or "guide".
 - **Navigational:** Users want to reach a specific website or page
 - **Commercial:** Users are investigating products or services with the intention of purchasing soon, often comparing options.
 - **Transactional:** Users are ready to buy, sign up, or download, and are usually searching for specific purchase options.

Keywords Types:

- **Long tail keyword:** Long-tail keywords are specific, 3+ word phrases with **lower search volume** but higher conversion rates, crucial for targeting niche, high-intent audiences. They fall into two types: topical (high-level, unique, demand-driving queries) and supporting (specific, less-popular variations that support main topics)
Example: **topical** → Modern Furniture Layout
Example: **Supporting** → Modern Furniture placement ideas, Outdoor modern furniture ideas
- **Low-competition keywords:** are highly specific, often long-tail phrases with lower search volume but less competition, allowing new or small websites to rank quickly and gain targeted traffic. They typically feature low **Keyword Difficulty (KD) scores**, often below 30, and high user intent.

Keywords Golden Ratio:

The Keyword Golden Ratio (KGR) is a data-driven SEO strategy used to find neglected, long-tail keywords with very low competition, allowing new or small websites to rank in Google's top 50–100 results quickly often within days or weeks.

It focuses on keywords with a search volume under 250, ensuring that the ratio of "**allintitle**" results to search volume is 0.25 or less

$$\text{KGR} = \frac{\text{Number of Allintitle Results}}{\text{Local Monthly Search Volume (under 250)}}$$

- **Allintitle Results:** The number of competitors who have the exact keyword in their page title (found by searching allintitle:"your keyword" in Google).
- **Search Volume:** Local monthly searches (typically < 250).
- < 0.25: Excellent. High chance of ranking in the top 100 within days or weeks.
- 0.25 - 1.00: Moderate. Good chance to rank, but might take longer.
- > 1.00: Poor. High competition; difficult to rank quickly.

Keywords Types:

- **Niche keywords:** are highly specific, long-tail search phrases (usually 3-5+ words) targeting a narrow audience segment, offering lower competition and higher conversion intent compared to broad terms. Example: “vegan baby soap.”
- **Branded and unbranded keywords:** Branded keywords include a company name or specific product, signaling high intent and high conversion rates
- **Your competitors’ keywords:** You can know it by searching with their website on [Moz.com](https://moz.com) or other tools.

How to choose the Keyword?

1. **Search volume:** The more people search for a keyword, the more traffic you can get from it.
 2. **Click Through Ratio**
 3. **Difficulty:** If your site is new (or doesn't have a ton of links yet), target low-competition terms at first. Then, as your site grows in authority, you can start to target more competitive stuff.
 4. Using high **Cost Per Click (CPC)** keywords in SEO can be effective for identifying high-value, high-intent topics that promise significant revenue, but they are often too competitive for new sites
- 

Tips to Rank for specific Keywords:

- **Barnacle SEO:** allowing a business or website to attach itself to a large website that ranks predominantly for its desired keywords to earn traffic, leads, and potentially, increases in rankings.

Example (**Review Sites:** Yelp, TripAdvisor, Google Business Profiles. **Directories:** Yellow Pages, Angie's List, **Content Platforms:** Medium, LinkedIn, YouTube, SlideShare.)

- **Topical Authority & Cluster Strategy:** Rather than optimizing for one keyword per page, build authority around a broad topic.
 - **Google Keyword Trend:** <https://trends.google.com/trends/>

Pillar & Topic Cluster

Topic Cluster Approach:

Let's say you're a marketing agency who has a great Blog.

While you had thousands and **thousands of blog posts** about everything marketing, sales, and advertising under the sun, they weren't organized and some of the posts were even **competing** with each other because they were so similar.

Think about it -- when we had 10 different blog posts about "Instagram tips," some of them had overlapping content and similar URL structures that started to **compete with each other** in search engine results pages (SERPs).

Topic Cluster Approach:

Topic Cluster Approach:

Under the topic cluster model, instead of creating blog posts designed to rank for specific, long-tail keywords, we organize blog posts into specific topic areas -- **anchored** together by **one webpage** that provided a broad overview of the topic, which then **hyperlinked** out to **more specific**, deep-dive blog posts that made up a topic cluster.

Let's visualize it? Here's what it looks like now:

- **Topic:** Instagram Marketing Pillar
- **Content:** Instagram Marketing
- **Cluster Content:** The Anatomy of a Perfect Instagram Profile, How to Write Good Instagram Captions: 8 Bookmarkable Tips for Perfecting Your Copy, How to Use Instagram Stories: A Simple Guide for Marketers

Topic Cluster Approach:

The goal of organizing our blog using topic clusters was so our infrastructure would look a little more like this:

Topic Clusters

How to Execute Clustering?

Step 1: Organizing

- **Organize & Prioritize** the blogs: For example, we decided to start with all the blogs about sales.

Step 2: Identifying

- **Pillar Page:** A pillar page covers the topic **broadly**, so a visitor could answer any basic questions about the topic. It shouldn't delve too deeply into answering specific questions.
If we have a blog post that meets this criteria, then it is great -- we have the content we need to create a pillar page. If not, we need to create it.
- **Content Gaps:** Once we've conducted our keyword research, we choose the keywords related to our topic that have the highest search volume. Then, determine if we've already written a blog post about that keyword, or if we need to write a new blog post.
Note: We might already have content that addresses the keyword, but we might need to use on-page SEO strategies to target a blog post for that keyword.
- **Content Duplicates:** We may have several blog posts that cover topics in an overlapping way that are ranking for the same keywords and competing against each other. Combine the information in these posts on the highest-ranking URL, and redirect the other blog posts towards it.

Step 3: De-Linking and Re-Linking

Manually review every blog post and remove all of the internal hyperlinks so, once the pillar pages were created, we could **internally link only within the topic cluster** to improve the domain authority of every blog post and webpage in the cluster. (In fact, Barby recommends one hyperlink per 150 words.)

Content Optimization

Content Optimization

Content optimization is the process of **improving the quality** and **relevance** of content to ensure it **ranks higher** in search engine results, **engages** the target audience, and **achieves** specific business goals.

This involves:

- Using relevant keywords
- Creating high-quality and valuable content
- Enhancing readability
- Optimizing meta tags and images
- Ensuring the content is mobile-friendly and fast-loading.

How to optimize content for SEO?

- **Target keywords with traffic potential:** Optimizing for a keyword that nobody searches for is pointless. Even if you rank #1, you won't get any traffic. To identify keywords with high traffic potential, go back to the Keyword Planning Step
- **Make sure it aligns with search intent:** The easiest way to understand search intent is to use the current top-ranking results as a guide. Analyze them for the three Cs of search intent:
 - **Content type:** The type of content on the SERPs (e.g., blog post, product page, landing page, category page). If the top 10 positions for your keyword show blog posts, stick to blog posts.
 - **Content format:** The content format in the search results (e.g., how-to, step-by-step guide, listicle (List of articles), review). The top-competing posts will indicate what the searcher wants to know.
 - **Content angle:** The unique selling point of the competing content on the SERPs (e.g., discounts, inexpensive strategies, free shipping). While it's crucial to stand out from the competition, you should still consider the similarities between top-ranking posts.

How to optimize content for SEO?

- **Make sure it covers everything searchers want to know:** The idea here is to identify potentially missing subtopics that searchers want to know and brainstorm how you can do better.

Instead of manually combing through competitor content, use a tool like [Ahrefs 'AI Content Helper'](#). The tool provides a content score out of 100, showing you exactly where your content stands compared to top-ranking pages. When you input your target keyword, it analyzes:

- **SERP's search intent:** Which of the intents in the SERP do you want to optimize for.
- **Content depth:** Whether you're covering the topic comprehensively.
- **Topical coverage:** What subtopics you might be missing.

Helper doesn't just ask: "Did you mention this keyword?" It asks: "Did you meaningfully cover the concepts people expect when searching for this?"

[Watch AI Grader & AI Content Helper Reports](#)

How to optimize content for SEO?

- **Make sure it's easy and enticing (tempting) to read:** Most people don't read web pages from beginning to end. Instead, they scan the main points and pick out phrases that jump at them.
 - **Eliminate fluff:** Clichés, low-impact adverbs, and **hard-to-read** sentences repel users. Before publishing your post, use the [Hemingway Editor](#), [Grammarly](#), or [ProWritingAid](#) to catch these errors.
 - **Increase visual comprehension:** Long walls of text overwhelm readers. Use **short paragraphs and bullet points**, have **bold key takeaways**, and include **relevant images** to make your post more reader-friendly.
 - **Add a table of contents (ToC) in long posts:** The ToC offers easy navigation and tells readers the list of topics covered.
 - **Prioritize important information:** A well-optimized post makes valuable information accessible. Don't make readers dig through them! Put your best ideas at the top. Leave the nice-to-know information at the bottom.

How to optimize content for SEO?

- **Make sure it has a compelling title tag and description:** The title tag and meta description is the first thing searchers see on the SERPs. Ideally, they should describe what your content is about at a glance.
 - **Match search intent:** It should be clear that your page matches what the searcher is looking for from your title tag and meta description alone.
 - **Keep them short and sweet:** Google truncates (Cut/Hide) title tags and meta descriptions after a certain length. This is usually around 70 characters for title tags and 120 characters for meta descriptions, although it varies.
 - **Include your keyword:** This helps searchers see at a glance that your page is a relevant match to their search.
 - **Highlight specificity:** Specific data points increase credibility and respect. Compare “How to Attract Customers in a Month” with “How to Attract 2,738 Customers in a Month on a Shoestring Budget.” Which compels you to click more?

How to optimize content for SEO?

- **Make sure it has enough backlinks:** Backlinks help you get into Google's good books, as they're one of the top three ranking factors. A search traffic study discovered that the more backlinks a page has, the more organic traffic it attracts.
- **Make sure you're eligible for rich snippets:** Just compare these two results — which one would you rather click?
 - **Use your CMS or a plugin** (like Yoast or All in One Schema). Just fill out some information, and it'll add the code for you.
 - **Use a schema markup generator.** There are plenty of these around (e.g., Merkle's Schema Generator).

How to Optimize Content for AI?

How to Optimize Content for AI?

Before you chase AI optimization tactics, consider these facts:

- AI chatbots is responsible for no more than **1% of total traffic** to your website.
 - **Google sends about 199 times more traffic** than ChatGPT, Perplexity, Copilot, and Gemini combined.
 - There are virtually no proven case studies of *AI-specific* tactics driving real business results so far.
- 

Simple Rules for AI Optimization:

- **Rule 1: SEO is still your foundation.** The same content that ranks well in Google is more likely to be referenced by AI systems. Focus on traditional SEO fundamentals first.
- **Rule 2: Build brand mentions, not just backlinks.** [Ahrefs analysis of 75,000 brands](#) shows web mentions matter more than backlinks for AI visibility.
- **Rule 3: Don't manipulate, just be helpful.** AI systems are easily gamed right now, but those shortcuts won't last. Create genuinely useful content instead of trying to trick algorithms.
- **Rule 4: Brand awareness beats optimization tricks.** [Brands in the top 25% for web mentions get 10X more AI citations.](#) Focus on building recognition, not gaming systems.

How to Optimize Content for **Social Shares**?

- **Include expert quotes:** Unique quotes from subject matter experts boost distribution.
 - **Share unique insights:** Readers are more likely to share content that contains unique insights, whether it's original case studies, data studies, surveys, or just relevant personal experience.
 - **Use more visuals:** Visuals can increase shareability it two ways.

10 Tips to Improve Your Content

1

Find the Right Keywords:

Use tools like the Keyword Magic Tool to perform keyword research before you begin writing a piece

2

Find Questions People Ask:

Leverage SERP features like the People Also Ask (PAA) box to find out what your users actually want to know

3

Identify and Satisfy

Search Intent:

Identify search intent for your keywords and create appropriate content

10

Keep Linking

Structure in Mind:

Both users and Google Bot will benefit from strong internal linking structure, meaning you can help users and improve on-page SEO elements at the same time

9

Include CTAs:

Calls to action provide logical next steps for users who land on your page

8

Include Visuals:

Keep your readers engaged and encourage social media shares by creating visuals for your content (like this infographic!)

7

Create Organized,

Easy-to-Read Content:

Users want answers quickly, meaning they should be able to skim your content easily to find what they need

6

Optimize Headers, Titles, and Meta Descriptions:

Don't just optimize for keywords. Keep your reader at the center with skim-able and user-friendly content

4

Review Competitors'

Articles:

Use Keyword Gap tool to see what's working for your competitors

5

Create Linkable Assets:

Create original research, case studies, and in-depth guides that are engaging and shareable

Content Optimization Tools

- [Ahrefs](#): allows you to find keywords with traffic potential, find content gaps, monitor your ranking performance, and more. Also, check out our [free AI writing tools](#).
